Summary

Developer with 5+ years of professional software development experience, having moved from frontend into backend and distributed systems since 2023. Design and ship event-driven microservice architectures, gRPC-based inter-service communication, and Web3 integrations (Solana, TON) for fintech and consumer products.

Skills

Languages & Frameworks: Node.js, NestJS, Go, TypeScript | JavaScript

Data Layer: PostgreSQL, MongoDB, Redis, Redis Streams, Prisma ORM

Messaging & Queues: BullMQ, Kafka, RabbitMQ

Infra & Observability: Docker, Sentry, New Relic

DevOps: Github | Gitlab CI, Digital Ocean, Timeweb

Testing: Jest, Testcontainers, Golang Test Library

Architecture: Microservices, Event-Driven design, gRPC, DDD

Blockchain: Solana, Ethereum (EVM), TON, Ethers.js, web3

Experience

Backend Developer | *PaIT.Fi* 02.2026 - 08.2026 (Project type)

Product: Token-based crypto platform with an integrated digital wallet, smart-contract interactions, tiered investment packages, and a referral partner system.

Problem: Build a secure and scalable platform where users can purchase and manage a proprietary token, participate in tiered packages, interact with smart contracts, and earn through a referral partner program.

- Application - designed an event-driven microservices architecture based on Kafka, spanning 19 services across 2 applications, to support token operations, user management, packages, calculations, referrals, and other core business workflows.
- Shared infrastructure - built and maintained a reusable internal backend library, standardizing common services and utilities across the platform and reducing duplicated implementation across microservices.
- Authentication - implemented centralized 2FA and SSO across 2 applications, with webhook-based synchronization achieving 99% delivery reliability through automatic retries.
- Business process - built a BullMQ sync processing system handling ~15K jobs/day, enabling reliable background processing for platform operations without blocking user-facing requests.
- Smart-contract integration - implemented backend integration with smart contracts to automate and enforce participant-related business rules on-chain. (via Moralis)

- Security - collaborated with the security team to identify and remediate vulnerabilities, improving the security and resilience of a platform handling token and user financial operations.
- Quality - implemented unit and integration testing using Jest and Testcontainers, reducing regression risk across critical business workflows. (60% of unit and core business logic integrational coverage)

Tech Stack: NestJS, PostgreSQL, Redis, BullMQ, Kafka, gRPC, Prisma, Sentry, New Relic, Blacksmith, Docker | Docker Compose, Go

Backend Developer | Defi Bank Online / YLDX.ai, 2025-2026

Product: admin platform for managing multiple white-label DeFi/fintech partners.

Problem: Build a centralized administrative platform that allows the company to manage multiple independent white-label partners from a single system, while providing secure access control, reliable data synchronization, and unified performance monitoring across partner environments.

- Microservice architecture - designed and implemented a gRPC-based microservice architecture, separating core administrative, partner, and data-processing domains and enabling reliable internal service-to-service communication.
- Access control & security - implemented an RBAC-based access management system, allowing administrators to provision users with predefined roles while users securely configure their own passwords and OTP authentication.
- Partner data synchronization - built a Go-based relay service responsible for synchronizing data from multiple partner systems into the central platform, reducing manual data transfer and providing a consistent data layer for administration and analytics.
- Cross-partner analytics - built a black-box metrics engine that aggregated and normalized performance data across multiple white-label environments, providing a unified view of partner performance without exposing the complexity of individual partner implementations.

Tech Stack: NestJS, PostgreSQL, Go, Redis, Prisma, gRPC

Backend Developer | CYNO.ONE (then YLDX.ai), 2023 - 2025

Product 1: Telegram Mini App for purchasing, sending, opening, and withdrawing digital gifts with TON integration and an internal balance system.

- Built a Telegram Mini App with TON integration, an internal balance system, a gift-sending/withdrawal flow.
- Identified a race condition in concurrent balance operations after launch, creating a double-spend risk.
- Redesigned transaction handling using PostgreSQL's transactional model with Serializable isolation, eliminating the double-spend bug.
- Handed the product to the owner for continued development; currently live with 117,000+ monthly active users.

Product 2: Automated trading infrastructure for Solana token market for private trading team.

- Real-time market monitoring - built the backend for an automated Solana trading bot that monitored PumpSwap liquidity pools via WebSocket and detected liquidity migration events in real time.
- Automated execution — implemented automated buy/sell execution based on configurable user-defined trading filters.
- Protocol resilience - patched the open-source PumpSwap SDK after a breaking protocol change, restoring swap functionality without waiting for an upstream release.
- Event-driven processing - designed the system around real-time blockchain events rather than polling, reducing detection latency and unnecessary API requests.

Product 3: Transmatika. B2B digital platform for transportation companies focused on fuel cards, toll roads, tax refunds, cost management, and fleet expense analytics. The platform provides card management, real-time transaction notifications, analytics, and automated cost-control workflows.

- Cost management platform - developed functionality for managing transportation expenses and fuel-card operations within a centralized B2B platform.
- Real-time financial operations - worked on transaction processing and event-driven workflows supporting real-time visibility into card activity and business expenses.
- Business analytics - implemented backend functionality supporting reporting and analytics for transportation companies and management.
- Automation - contributed to automating operational and cost-control processes, reducing the amount of manual work required to manage transportation expenses.

Frontend Developer | LLC "Dwellers", *Real Estate Marketplace in Israel* | 2021-2023

Product: Israel real-estate marketplace platform

- Built the MVP for a real-estate marketplace targeting the Israeli market.
- Designed a custom UI kit in Tailwind CSS, prototyping every component before implementation.
- Integrated with a Python/FastAPI backend; built user and seller dashboards with custom Mapbox map views.

Tech Stack: Flask, Docker, Postgresql, Redis, React.js, Redux, Gsap, JQ, Mapbox
